

ClaimsVoice

Reimagining Motor FNOL with Conversational

From first customer conversation to intelligent claim action,
powered by Sarvam AI.

Prepared by: Mudit Sharma

Reimagining Motor FNOL with Conversational AI

A multilingual, voice-first claims experience that transforms a natural customer conversation into structured, policy-aware claim action.

Speak Naturally

Customers report an accident in Hindi, Hinglish or English — without navigating complex forms or insurance terminology.

“

“कल रात ऑफिस से निकलते समय एक गाड़ी सामने से आकर टकरा गई। बम्पर और टायर में नुकसान हुआ है।”

Hindi • Hinglish • English

Understand Intelligently

AI progressively captures incident details, maintains context and identifies what information is still required.

Understanding from conversation

 Date & Time	Captured	
 Location	Captured	
 Type of Incident	Captured	
 Vehicle Damage	Captured	
 Injury to Any Person	Yet to confirm	
 Additional Details	In progress	

Act Immediately

Enterprise workflows validate policy and coverage, apply business rules, and register eligible claims or route exceptions for specialist review.

Outcome

	Eligible Claim Claim registered automatically	>
	Specialist Review Routed to expert for review	>
	More Information Needed Guided to capture missing details	>

“ From the first words after an accident to the first action on a claim — through one guided conversation.

The Problem

Motor Claims Are a High Volume, High Friction Journey

At motor claim scale, every additional interaction at FNOL compounds into higher operational effort, slower processing and a more difficult customer experience.

6.35 Lakh

Motor OD claims
intimated in one year

United India Insurance received 634,789 Motor OD claim intimations in FY25 and settled 614,122 claims.

96,794

Motor OD claims
remained outstanding

United India Insurance reported 96,794 outstanding Motor OD claims at the end of FY25, despite clearing 70,000+ claims.

24.8%

Share of insurance
complaints from motor

Motor insurance represented 24.8% of total insurance complaints in FY25, reinforcing how important the motor claims experience is to trust.

870 Million

Internet users accessed
Indic language content

98% of India's internet users accessed the internet in Indic languages in 2024, while 57% of urban internet users preferred Indic language content.

Scale

A single large insurer is already handling more than half a million motor claim journeys annually.

Operations

Reducing manual intake, incomplete information and follow ups can materially improve operations.

Experience

Claims experience is a key driver of policyholder trust and satisfaction.

Accessibility

A claims journey designed primarily around English can create friction for a market that naturally interacts across Indian languages.

1 Accident Occurs

Customer may be stressed or stranded or dealing with vehicle damage

2 Find the Right Channel

Navigate app, website, IVR or contact centre

3 Explain What Happened

Communicate naturally, in the language customer is comfortable with

4 Translate the Story into Claim Data

Date, time, location, damage, injury, third party involvement and vehicle condition

5 Validate Policy and Coverage

Identify the policy and determine applicable protection

6 Resolve Missing Information

Incomplete intake creates additional interactions and operational effort

7 Claim Initiated

Only then can the downstream claims process begin

The fundamental disconnect

Customers want to explain what happened, in the language they are comfortable with. Insurers need that conversation converted into complete, structured and actionable claim information.

The opportunity

Create a simpler FNOL experience that understands the customer's natural conversation, captures the right information the first time and reduces dependency on assisted channels for routine claims.

Move from Form Filling to a Guided Claims Conversation

The customer should not need to understand the FNOL process. The experience should understand the customer and guide them through it.

Built to Make Conversational AI Work at India Scale

For an insurer, the challenge is not deploying another AI model. It is delivering a reliable voice experience across India's languages while retaining enterprise control, scalability and a path to broader adoption.

01 Serve More Customers in Their Natural Language

Meri car ka accident kal office ke bahar hua.

Business value

Broader digital adoption without forcing customers into English-first journeys or rigid digital forms.

02 Create a Truly Conversational Digital Channel

Business value

Move routine interactions from contact centre dependency toward a 24x7 conversational self-service channel.

03 Automate Without Giving Up Control

Business value

Capture the productivity benefits of AI while insurer-defined policy, coverage and claims rules continue to govern decisions.

04 Build Once, Expand Across Customer Operations

Business value

FNOL becomes the first use case on a reusable conversational AI foundation, not another point solution.

The strategic value of Sarvam is not just better Indian language AI.
It is the ability to make conversational automation accessible to a much broader Indian customer base.

More Customers
Digitally Served

Lower Cost to
Serve

Stronger Digital
Advantage

ClaimsVoice Architecture

A conversational intelligence layer that connects customers to the insurer's ecosystem, using AI for understanding and orchestration while enterprise rules retain control.

The Business Case: Shift Routine FNOL from Assisted to Conversational Self Service

At scale, the value comes from reducing assisted handling for routine FNOL while improving intake completeness and giving claims teams more capacity for complex cases.

₹2.98 Cr

BEYOND COST SAVINGS – STRATEGIC BUSINESS IMPACT

70% Routine
Intake Containment

Routine FNOL can begin and progress without requiring a contact centre agent for every interaction.

24x7 Claims Intake

Customers can initiate claims immediately without being constrained by contact centre capacity or operating hours.

More Complete
First Interaction

Progressive information capture can reduce missing information and avoidable follow ups before downstream processing begins.

Human Capacity
Redirected

Claims specialists can spend more time on injuries, coverage exceptions, fraud indicators and complex claims.

VALUE SCALES WITH ADOPTION

AI CONTAINMENT	FNOL VOLUME HANDLED BY AI	ANNUAL SAVINGS (ILLUSTRATIVE)
50%	250,000	₹2.10 Cr
70% (Base Case)	350,000	₹2.98 Cr
80%	400,000	₹3.40 Cr

Higher containment delivers exponentially higher savings and better CX at scale.

The objective is not to remove humans from claims.
It is to use human capacity where judgement and empathy create the greatest value.

Lower Costs

Faster Intake

Better
Experience

Stronger Outcomes

Assumptions: Illustrative business case based on 500,000 annual FNOL interactions, ₹100 assisted handling cost, ₹15 conversational AI interaction cost and 70% AI containment. Actual economics will vary based on interaction duration, infrastructure, AI consumption, integration, containment and insurer operating model.

Limitations & Next Steps

From PoC to Production in 90 Days.

What's Missing for Production

Enterprise Integrations

Connect with core systems – policy admin, claims, CRM, DMS and contact centre platforms.

Claims Governance

Configure production rules, exceptions, human handoffs and guardrails.

Security & Compliance

Enterprise-grade security, privacy, data protection and regulatory compliance.

AI Validation at Scale

Validate speech, language, extraction accuracy and hallucination control with real customer data.

Scale & Operations

Ensure performance, reliability, monitoring, fallbacks, DR and 24x7 support readiness.

Next Steps: 90-Day Enterprise Rollout

Days 0–30

DISCOVER & INTEGRATE

- Finalize journeys, languages, fields, rules & exceptions
- Integrate with policy, customer & claims systems
- Define success metrics and baseline KPIs

OUTCOME

Production design and integrated foundation

Days 31–60

VALIDATE & HARDEN

- Validate with real-world accents, languages & scenarios
- Implement operational controls, human handoff & guardrails
- Security, performance, resilience & integration testing

OUTCOME

Enterprise ready controlled pilot

Days 61–90

PILOT & SCALE

- Launch with controlled cohort and selected motor journeys
- Measure KPIs: containment, completion, accuracy, CSAT, latency & escalations
- Optimize based on insights and expand

OUTCOME

Measured production rollout with scale decision

Our Goal

Deliver measurable impact, delight customers and run efficient claims operations at enterprise scale.

The background is a dark blue gradient with a prominent, flowing, wavy line of lighter blue and white light that curves from the left towards the right. Scattered throughout the background are several out-of-focus circular lights (bokeh) in various shades of blue, white, and a hint of orange, creating a sense of depth and movement.
